

National EOSinophilic Week

raising awareness of eosinophilic diseases

2-8 August

#NEOSW2026

ausEE Inc.

a charity dedicated to improving lives affected by an eosinophilic disease

Eosinophils are a type of white blood cell involved in certain immune responses. When too many eosinophils build up in parts of the body, they can cause inflammation and tissue damage. This may indicate an eosinophil-associated disease (EAD). There are different types of EADs, and diagnosis usually depends on where in the body the eosinophils are found and what symptoms a person has.

Eosinophil-associated diseases can significantly impact quality of life and often require ongoing monitoring and long-term management.

As part of National Eosinophilic Week, landmarks across Australia and New Zealand will illuminate pink and purple, the colours representing eosinophils, in support of our #EOSLightUp campaign.

Free video presentations featuring healthcare specialists are available through our Virtual Education Program.

**TOP 8
CHALLENGE**

Eosinophilic oesophagitis (EoE) is a type of eosinophil-associated disease. One treatment option is an elimination diet, which removes common food allergens.

Take the Top 8 Challenge on 8 August to raise awareness and support research into eosinophil-associated diseases.
